The following table shows the results of the regression analysis for the dependent variable "Number of children" (Y-axis) and the independent variable "Age" (X-axis). The table includes the regression equation, the coefficient of determination (R-squared), and the p-value for the regression coefficient.

Variable	Regression Equation	R-squared	p-value
Age	$Y = 0.05X + 1.5$	0.15	0.001

The regression equation indicates that for every unit increase in age, the number of children increases by 0.05 units. The R-squared value of 0.15 suggests that 15% of the variance in the number of children is explained by age. The p-value of 0.001 indicates that the regression coefficient is statistically significant at the 0.001 level.

The following table shows the results of the regression analysis for the dependent variable "Number of children" (in thousands). The independent variables are "Year" (1990, 1995, 2000, 2005, 2010, 2015, 2020) and "Gender" (Male, Female). The coefficients are estimated using ordinary least squares (OLS). The standard errors are shown in parentheses below the coefficients. The adjusted R-squared value is 0.85.
